

BENIGN PROSTATIC HYPERTROPHY

If you have been diagnosed with BPH (Benign Prostatic Hypertrophy), and suffer from urinary frequency, nocturia (voiding frequent at night), and still produce only a weak stream, and do not empty your bladder completely, there is a new treatment available. We recognize there are medications available which are expensive and have side affects such as nausea, blurred vision, sexual dysfunction, and disorientation. There are several forms of heat treatment for this condition which has been approved by Medicare and all insurance companies. One of these procedures is called a TUNA procedure (Transurethral Needle Ablation), which is done on an out-patient basis. You can return to your normal activities within three to four days. BPH is a very common condition in men over the age of 55-60. If you have these symptoms, and are interested in a minimally invasive form of treatment, which would relieve you from the symptoms, and the need for expensive medication, please call Urology Associates (512) 244-0161.
